

What is a one-way system in school?

Dr. Siobhan Timmins

There is a virus making people ill. This virus spreads quickly from one person to another. Most people who catch the virus get better at home.

A few people need hospital
where doctors and nurses
will help.

One way of stopping the virus spreading is for people to stay further apart.

In school children used to walk along the corridors in both directions. Lots of children were close together.

To stay further apart children now walk in one direction in the corridors. This makes more space between children moving around the school. More space between us keeps us safe and healthy.

Walking in one direction is called a one-way system. Adults will remind us which direction to walk in. There may be signs to help too. The signs may look like this.

I will try to remember to walk in one direction along the corridors at school. This will help keep me and others healthy.
